

Connecting the Internet of Things with People.

### Asset Tracking Solution

Transcends' mission is to make RFID implementations simple. Prebuilt solution components ensure quick turnarounds and maximize your ROI.

The Asset Tracking solution tracks assets, records the last seen location and keeps a history of all locations the asset has been seen. Tracking assets allows companies to increase asset utilization, establish an audit trail, automate workflow processes and reduce lost items.

### Tool Crib:

Some manufacturing plants use expensive tools which are shared between numerous workers. Check in / check out of those tools might be regulated but still it is often unclear who used the tool last and where it might be at the present time. Valuable time is wasted searching for a tool. Purchasing more tools is too expensive.

Transcends has implemented Tool Crib solutions for customers automating the audit process and registering when what tool is being moved in or out of the storage facilities. There is never any doubt anymore when and who has checked out the tool last, or has it been brought back afterwards. This solution significantly reduces any time spent for searching.

TOOL CRIB

### Specifications:

The solution tracks assets and records their location (reader ID) with EPC tag ID and timestamp. It works with all fixed readers that are supported by the Rifidi Edge Server. 10 readers are supported out of the box, additional reader support can be added for 5% of the base price.

Connecting the Internet of Things with People.

### Action Photo:

Mountain bikers enjoy their sport not only during their actual activities, but like to share the fun with pictures taken of them and shown to friends or for their own collection. The system built by [Sniper Action Photo](#), built on the Rifidi Edge Server, is an example of "seeing" the bike race by and automatically taking a picture that is correlated with the bike and / or the rider. Such high speed movement can be detected and trigger actions, as taking a picture.
